

Project Title- Prediction of IPL match

By Nikhil Munakhiya

ABSTRACT

Prediction of the team winning the IPL match by using different factors like toss, location and some others factors. As we know in any sports the data available is really too much which opens opportunity for us to try different analysis. Being interested in cricket since childhood I am always curious to know who will win. So by using small yet so large data set of IPL matches we can conclude our decision regarding the same. And if done successfully we can use this to predict bigger leagues like world cup data.
