

Abstract

In this Globalized world, sustainability is the key to move forward as can said by various scientists and activists. United Nations has set a Sustainable Development Goals (SDGs) for all its member states. So, we have used some of the indicators such CO₂ emissions per capita, mineral rents (% GDP), Oil rents etc. for top 10 growing economies and have seen how they perform in coming years and did they align they sustainability goals or deviate from it. To compare the data, we will look for leading institutes such as World Bank. All the data is open source and extracted from UNs World Bank SDGs databank.
