

Predictive analysis of startup funding in India

Abstract

Startup ecosystem is shifting gears in India given the advent of various national and international policies. More and more individuals are now being motivated to start their own ventures and it will certainly give us a big stride towards self sufficiency and economic boost. However, as startups emerge, it creates problem for investors on whom to fund and how much. In this case, predictive analysis techniques can be quite useful in solving these major issues by taking into considerations previous statistics and certain parameters like industrial category of the startup etc and using techniques like regression and k-means clustering.
