

Analysis of percentage distribution of rural and urban households having access to electricity

Abstract

Electrification and electricity services are vital to both the economic and social development of any country especially a developing country like India. Access to electricity services provides better delivery of social services and provides access to more income opportunities. To understand the state of electricity services in the country we analyzed the National Sample Survey data and the census between 2001- 2011. We established a growth trend for each state across the decade in rural and urban households to get a clear image of how far we have come in providing access to electricity services to our citizens.
