Analysis of performance of top & bottom performing Indian states

Using parameters like GDP, Per capita income, HDI, Unemployment rate, Crime rate etc.

Abstract

The performance of state is decided by its GDP, Per capita income, HDI, Unemployment, crime and others. Using these parameters here I am going to analyse the similarity and differences in factors affecting growth of top and bottom performing states. And find out how these parameters are affecting the other parameters and overall performance of state. Moreover, I will predict the future trend of these data and find out the problems that will be faced and how to overcome these problems and increase the growth of poor performing states. I will use bar and line graph and model that will best captures the trend using R.
